	urgent	not urgent
Important	DO - (YOUR MVP) - read a training log CSV (columns like step, loss, gradient norm) - flag NaN or infinite values and the step where they first appear - flag stalled loss (no meaningful improvement over the last N steps) - flag exploding gradients (a sudden spike that is far above the recent average) - print a summary report of each problem and roughly when it started	SCHEDULE - (FOR V2.0+) - let the user set thresholds with command-line flags (stall window, spike size) - plot the loss curve with problem spots marked - save the report as a json or text file - watch mode that checks a log while training is still running
Not important	DELEGATE - (USE A LIBRARY) - CSV parsing → Python's built-in csv module - command-line arguments → argparse - plotting (for v2) → matplotlib	DELETE - (CUT IT) - web dashboard or gui - an ml model that predicts failures - email or slack alerts
